RESEARCH EXPERIENCE

Post-doctoral Fellow - Harvard Sep 2023 - present

- Developed algorithms and performed analysis on differentially private distributed mean estimation for private federated learning, using correlated privacy mechanisms among users for improved privacy-accuracy trade-offs and increased resilience against dropouts and colluding users.
- Provided an information-theoretic formulation to the problem of *private approximate nearest neighbor search* for vector database querying, and designed algorithms that ensure perfect privacy.
- Developed metrics and performed analysis on multi-group proportional representation in database retrieval and Generative AI.
- Reported the representational gaps in existing text-to-image generation models and developed an algorithm to mitigate the representational biases in them.
- Contributed to the preparation of a grant proposal on *Information-Theoretic Foundations of Vector Databases*.

Graduate Research Assistant - UMD Aug 2018 - Aug 2018

- Obtained capacity results with achievable schemes and converse proofs for different variants of semantic private information retrieval using concepts from information theory and coding theory.
- Developed coding schemes to perform private read-write operations in efficient variants of private federated learning.
- Characterized the rate-distortion and rate-privacy-storage trade offs in private read-write operations along with achievable schemes.

- Developed algorithms for practical variants of private federated learning (in relation to private read-write operations), addressing challenges such as storage constraints and enhancing utility with controllable information leakage.
- Contributed to the preparation of two grant proposals on *Private Distributed Learning*.
